

envoy – the secure data transfer system

Trouble-free data transfer

envoy is a file transfer solution for secure file exchange – the perfect tool for transferring your data to or receiving data from Mohn media. Unlike other solutions such as FTP, envoy encrypts the data all the way from the supplier to the user’s workstation. Even on the envoy server only encrypted data is stored. Furthermore, the envoy workflow allows you to attach metadata and processing information to your data packets. This makes communication between you and Mohn media even more simple and secure! The fragmentation of the

data into small packets makes data transfer with envoy resistant to interruptions. You can even send extremely large volumes of data trouble-free with envoy. With the envoy client installed on your local system, you can simply send your data packets via drag-and-drop. You can always monitor the transmission state of your data in the envoy window. envoy is a data transfer system specially developed for the advanced requirements of Mohn media customers and is compatible with all widely used computer systems (Windows, Mac and Linux)

Your advantage

- Permanently secure data encryption
- Clear and intuitive handling
- Unique user identity authentication enables immediate allocation of the data packets
- Immediate start without prior login
- Trouble-free data transfer due to interruption-resistant transmission
- Additional information on each individual transfer
- Also suitable for transferring extremely large data volumes
